                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   backbone of PNAs is resistant to both nucleases and proteases. PNAs bind nucleic acid molecules with greater affinity than DNA or RNA concentration. The compounds are relatively simple to synthesize and are used in a wide variety of applications. This sequence represents a DNA oligomer which is used to represent the effect of single base mismatches
The present invention relates to a method of detecting mutations in a nucleic acid by amplifying the nucleic acid to produce a double-stranded amplicon, in vitro transcription and translation of this amplification, and detection of the translated protein. The primers used for amplification are designed to produce an amplicon that is translatable and allows differentiation between translation products of wild-type and mutated nucleic acids. The method is used to detect mutations in tumour suppressor genes, for (early) diagnosis, monitoring and characterisation of tumours (especially of bladder and intestines) and in the germ line (using nucleic acids from embryos or blood cells). A new multi-tag vector is used to detect or verify the reading frame of a nucleic acid cloned in it, and to determine the suitability of detectable peptides for analysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mutation detection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAL49453

The present sequence encodes a tag peptide and was used in the invention
                     nucleic acid by amplifying the nucleic acid to produce a double-stranded amplicon, in vitro transcription and translation of this amplicon, and detection of the translated protein. The primers used for amplification are designed to produce an amplicon that is translatable and allows differentiation between translation products of wild-type and mutated nucleic acids. The method is used to detect mutations in tumour suppressor genes, for (early) diagnosis, monitoring and characterisation of tumours (especially of bladder and intestines) and in the germ line (using nucleic acids from embryos or blood cells). A new multi-tag vector is used to detect or verify the reading frame of a nucleic acid cloned in it, and to determine the suitability of detectable peptides for analysis and/or purification of a recombinant protein, expressed from a sequence cloned in the vector. The present sequence encodes a tag peptide and was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Detecting mutations in nucleic acid, useful for characterization of tumors, by amplification, in translation, then protein detection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    15-FEB-2002; 2002WO-EP001651
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     29-AUG-2002.

                                                                                                                                                                                                                      The present invention relates to new human pre-adipose cell lines capable to differentiate to white adipose cells, exhibiting essentially the same cellular properties of normal white adipose cells. The human pre-adipose cell lines are useful for the identification of substances controlling the regulation of lipid uptake and release by human white adipocytes, and substances controlling the differentiation of preadipocytes into mature adipocytes. They are useful for screening compounds capable to regulate the secretion of any metabolites or hormones from human white adipocytes. Sequences of the invention are useful for developing drugs, food ingredients and supplements against obesity, diabetes and cardiovascular diseases. The present DNA sequence is a reverse transcription (RT)-PCR primer which is used for the expression of adipocytes in differentiated immortalised human preadipose cells. This primer is used in the cardiocal sequence is a reverse transcription of the cardi

RESULT 2736
AAD22531/c
                        used to decrease the expression of oncogenes and thereby decrease the expression of cancer cells which rely upon oncogene expression for their phenotypic and pathological properties. The oligoribonucleotides are also used for increasing the effectiveness of antisense oligonucleotide targetted to a gene associated with a disease or a condition in an animal. To alter gene transcription and/or translation for any gene or gene segment responsible for expression, to inhibit viral reverse transcriptase, to inhibit the expression of leukaemia virus, hepatitis virus, oncogenes and human immunodeficiency virus. The present sequence is retroviral reverse transcriptase inhibitor DNP-poly [A] RNA fragment which is used in the transcriptase inhibitor DNP-poly [A] RNA fragment which is used in the treatment of moloney murine leukaemia virus (MULV) in mammals. (Updated on 07-AUG-2003 to correct OS field.) (Updated on 29-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             29-AUG-2003

                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to derivatised antisense oligoribonucleotides with enhanced membrane permeability and stability. The derivatised antisense oligoribonucleotide complementary to a sequence of nucleotides found in virus or a cell is useful for inhibiting e.g., viral reverse transcriptase. Derivatised antisense oligoribonucleotide is conjugated at the 2'-O position with a hydrophobic carrier reagent containing a poly substituted phenyl compound. The derivatised oligoribonucleotides are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Derivatized antisense oligoribonucleotide useful to inhibit e.g. viral reverse transcriptase comprises at the 2'-O position of the oligoribonucleotide, a hydrophobic carrier reagent containing a poly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Wang
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               substituted phenyl compound.

                                                                                                                                                                                                                                                                                                                                                        The present invention describes a vector (I) comprising operably linked CC recipient cell, preferably in bacteria such as Escherichia coli; (b) clearly send cetable marker region capable of being expressed in the recipient cell; and (c) a chimeric DNA construct comprising: (i) promoter or promoter cell region capable of being expressed in the recipient cell cell or by prokaryotic RNA polymerase; (ii) first, second, third and cell courth recombination sites, (iii) 3' transcription terminating and cell fourth recombination sites, or the second and third recombination sites or the first and cell fourth recombination sites, do not recombination site, or the third and cell fourth recombination sites, do not recombination sites, or the third and cell fourth recombination sites, do not recombination sites, or the third and cell fourth recombination sites, do not recombination sites, or the third and cell sequences. The vectors can also be used to convert a DNA fragment cell into an inverted repeat structure. Plants transformed with a vector from the present invention can be used in a conventional breeding scheme to conventional breeding scheme to conventional material sequence a celds. The present sequence characteristics or to introduce a celds. The present sequence represents an acceptor vector mucleotide cells. The present sequence represents an acceptor vector mucleotide cells.
                                                                                                                                      Matches
                                                                                                                                                                             Best
                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Enzymatic nucleic acid; RNA cleavage; Hepatitis C virus infection; HCV ribozyme; HCV expression; HCV replication; cirrhosis; virucide; liver failure; hepatocellular carcinoma; HCV infection; drug therapy; type I interferon; interferon alpha; interferon beta; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                             of the substrate sequences defined in the specification. The HCV ribozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or hepatocellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon, especially interferon alpha, beta or gamma or consensus interferon. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (RCV). The enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HH) motif where the binding arms comprise sequences complementary to of the substrate sequences defined in the specification. The HCV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (BLAT/)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ABX00240 standard; RNA; 15

                                                                                                                                                               The present invention relates to enzymatic nucleic acids which capacitically cleave RNA derived from Hapatitis C virus (HCV). The Expectifically cleave RNA derived from Hapatitis C virus (HCV). The CC enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin CC (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV ribozymes are useful for modulating the expression and/or replication of CC HCV. They can be used to treat cirrhosis, liver failure and/or hepatocellular carcinoma. The HCV ribozymes are also useful for treating condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon. Sepecially conterferon alpha, beta or gamma or consensus interferon. The present CC sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note: Some of the sequence data for this patent did not form part of the printed specification. The complete sequence data for this patent was CC obtained in electronic format directly from the USPTO web site at

Havens JR,
                                                                                                                                                                                                                                The present sequence is of a hydrazine treated hydrazide precursor phosphoramidite 15-mer, designated oligo 035, which was produced in an example from the invention and which includes a synthetic branching amidite compound. The invention describes an improved process for immobilisation of macromolecules including DNA, RNA, peptide nucleic acids, pyranosyl-RNA and peptides, especially macromolecules containing multiple reactive sites, to a substrate surface or other conjugation target. It also describes the preparation of oligos containing one or more hydrazides, which can be used for conjugation to surface binding moieties, or for other conjugation reactions. The process is useful e.g. in nucleic acid hybridisation based assays, DNA chip technology and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ABL57064;

                                                                                                                                                                                   The present sequence is of a trityl deprotected hydrazide phosphoramidite 15-mer, designated oligo 09, which was produced in an example from the invention. The invention describes an improved process for immobilisation of macromolecules including DNA, RNA, peptide nucleic acids, pyranosyl-RNA and peptides, especially macromolecules containing multiple reactive sites, to a substrate surface or other conjugation target. It also describes the preparation of oligos containing one or more hydrazides, which can be used for conjugation to surface binding moieties, or for other conjugation reactions. The process is useful e.g. in nucleic acid hydridisation based assays, DNA chip technology and biosensor
                                                                                                                                                                                                                                                                                                         Compound for binding macromolecule to substrate surface or conjugation targets, contains phosphorous containing reactive group, hydrazide protecting group and benzene ring, and has predefined formula.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Hydrazide phosphoramidite oligonucleotide

Compound for binding macromolecule to substrate surface or conjugation targets, contains phosphorous containing reactive group, hydrazide protecting group and benzene ring, and has predefined formula.

Example 3; Page 43; 120pp; English

The present sequence is of a hydrazine treated hydrazide precursor phosphoramidite 15-mer, designated oligo O39, which was produced in an example from the invention. The invention describes an improved process for immobilisation of macromolecules including DNA, RNA, peptide nucleic acids, pyranosyl-RNA and peptides, especially macromolecules containing multiple reactive sites, to a substrate surface or other conjugation target. It also describes the preparation of oligos containing one or more hydrazides, which can be used for conjugation to surface binding moieties, or for other conjugation reactions. The process is useful e.g. in nucleic acid hybridisation based assays, DNA chip technology and biosensor applications

phosphoramidite 15-mer, designated oligo 033, which was produced in an example from the invention. The invention describes an improved process for immobilisation of macromolecules including DNA, RNA, peptide nucleic acids, pyranosyl-RNA and peptides, especially macromolecules containing multiple reactive sites, to a substrate surface or other conjugation target. It also describes the preparation of oligos containing one or more hydrazides, which can be used for conjugation to surface binding moleties, or for other conjugation reactions. The process is useful e.g. in nucleic acid hybridisation based assays, DNA chip technology and

                                                                                                                                                                                                                                   The present sequence is of a hydrazine treated hydrazide precursor phosphoramidite 15-mer, designated oligo 037, which was produced in an example from the invention. The invention describes an improved process for immobilisation of macromolecules including DNA, RNA, peptide nucleic acids, pyranosyl-RNA and peptides, especially macromolecules containing multiple reactive sites, to a substrate surface or other conjugation target. It also describes the preparation of oligos containing one or more hydrazides, which can be used for conjugation to surface binding moleties, or for other conjugation reactions. The process is useful e.g. in nucleic acid hybridisation based assays, DNA chip technology and
                                                                                                                                                                                                                                                                                                                                                                                                                 Raddatz S,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Compound for binding macromolecule to substrate surface or con targets, contains phosphorous containing reactive group, hydra protecting group and benzene ring, and has predefined formula.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Raddatz S,
Havens JR,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is of a trityl deprotected hydrazide phosphoramidite 15-mer, designated oligo 031, which was produced in an example from the invention. The invention describes an improved process for immobilisation of macromolecules including DNA, RNA, peptide nucleic acids, pyranosyl-RNA and peptides, especially macromolecules containing multiple reactive sites, to a substrate surface or other conjugation target. It also describes the preparation of oligos containing one or more hydrazides, which can be used for conjugation to surface binding moisties, or for other conjugation reactions. The process is useful e.g. in nucleic acid hybridisation based assays, DNA chip technology and biosensor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       modified_base
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  modified_base

The invention describes an improved process for immobilisation of macromolecules including DNA, RNA, peptide nucleic acids, pyranosyl-RNA and peptides, especially macromolecules containing multiple reactive sites, to a substrate surface or other conjugation target. It also describes the preparation of oligos containing one or more hydrazides, which can be used for conjugation to surface binding moieties, or for other conjugation reactions. The process is useful e.g. in nucleic acid hybridisation based assays, DNA chip technology and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to methods and oligonucleotides for forming CC a triple-helix comprising a double helical nucleic acid comprising first and second substantially complementary strands, and an oligonucleotide bound to a purine-rich target sequence within the double helical nucleic acid, where the oligonucleotide binds in a parallel and antiparallel corientation, respectively, to target sequences on alternate strands of the double helical nucleic acid. The method has therapeutic applications, where gene expression is controlled by selective triple-helix formation within expression regulatory sequences of a target gene. The coligonucleotides can be used to of a target gene. The coligonucleotides can be used to open triple-helices, and are useful to detect the presence or absence of specific sequences within genomic DNA for diagnostic and therapeutic purposes. The oligonucleotides can be selected to specific sequences required by pathogenic double-stranded DNA including specific sequences required by pathogenic bacteria or viruses for replication or virulence, reducing their pathogenicity. Alternatively, the oligonucleotide can be chosen to target a unique sequence of the
                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                        pathogen which is not found in the genome of pathogen's host. The oligonuclectides can be used in cancer treatment by way of triple-helix suppression of specific oncogenes including those of endogenous or viral origin. Such therapeutic oligonucleotides are capable of forming triple-helices with such sequences in cancerous cells containing the activated oncogene, so preferentially killing or repressing the cancer causing cell. The present sequence represents an oligonucleotide used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    5

                                                                                                                                                                                            ABZ37501
                                                                                                                                                                                                            RESULT 2750
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to methods and oligonucleotides for forming CC a triple-helix comprising a double helical nucleic acid comprising first and second substantially complementary strands, and an oligonucleotide bound to a purine-rich target sequence within the double helical nucleic acid, where the oligonucleotide binds in a parallel and antiparallel corientation, respectively, to target sequences on alternate strands of the double helical nucleic acid. The method has therapeutic applications, where gene expression is controlled by selective triple-helix formation within expression regulatory sequences of a target gene. The oligonucleotides can be used to form triple-helices, and are useful to detect the presence or absence of specific sequences within genomic DNA for diagnostic and therapeutic purposes. The oligonucleotides can be used to pathogenic double-stranded DNA including specific sequences required by pathogenic bacteria or viruses for specific sequences required by pathogenic bacteria or viruses for
                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                    replication or virulence, reducing their pathogenicity. Alternatively, the oligonucleotide can be chosen to target a unique sequence of the pathogen which is not found in the genome of pathogen's host. The oligonucleotides can be used in cancer treatment by way of triple-helix suppression of specific oncogenes including those of endogenous or viral origin. Such therapeutic oligonucleotides are capable of forming triple-helices with such sequences in cancerous cells containing the activated oncogene, so preferentially killing or represent the cancer causing cell. The present sequence represents an oligonucleotide used in the methods of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A triple-helix comprising a double helical nucleic acid (DHNA) and an oligonucleotide which binds in parallel and antiparallel orientation, respectively, for targetting sequences on alternate strands of DHNA to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              oncogene suppression; cancerous cell; cytostatic; antimicrobial; ss
                                                     Oligonucleotide SEQ ID NO:622.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WPI; 2002-536030/57

                                                                                                                                                        The present invention describes a method for cleaving single-stranded concleic acid sequences at a desired location. Also described: (1) methods concleic acid sequences at a desired location. Also described: (1) methods concleic acid sequences at a desired location. Also described: (1) methods concleic acid sequence concleid. The family of peptides, collectively displaying at least a part of the diversity of the family, concleic acid that has been cleaved at a concided at least in part by a nucleic acid that has been cleaved at a concider; (3) a method for preparing a library comprising a collection of concider; (3) a method for preparing a library comprising a collection of concider; (3) a method for preparing a library of a diverse family of peptides, concided artibody variable region linked to a version of FIII anchor which does contend for producing a population or a library of immunoglobulin genes; and (6) a library of immunoglobulins that comprise members having at cast one variable domain in which at least one of CDR1 and CDR2 contain conception sequence one of contain sequences that display and/or express a diverse family of peptides or genetic packages that display and/or express a diverse family of contain conception, which can be subsequently used to produce libraries or peptides, polypeptides or proteins.                                          S
                                                                                                                                                                                                  CC primer in PCR, and the common 5' region present in every cDNA clone
CC serves as the 5' priming site. Denaturing and washing leave anchored cDNA
CC in each well. The library is now arrayed and normalised. The method was
CC used to identify and isolate clones encoding G-protein coupled receptors,
CC confectorly pathway of invertebrates and active effectors involved in the
CC olfactory pathway of invertebrates and vertebrates, e.g. odourant binding
CC proteins, or other olfactory or neuronal proteins. The identified
CC receptors and proteins are useful for identifying compounds that reduce a
CC target animal's sensitivity to odours, for manufacturing compounds or
CC devices that mask odours, or trapping invertebrates with odourants.
CC Semiochemicals (e.g. arometics or pheromone mimetics) can be developed
CC with desirable effects on specific species, for the development of pest
CC monitoring systems or non-toxic, species-specific pesticide alternatives,
CC for controlling insect feeding and breeding behaviour, detecting the
CC presence of small air-borne molecules, etc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is that of the 5' end of a cDNA clone isolated from a cDNA library e.g. a mosquito antenna library. A clone was isolated using a method designed to rapidly array and normalize a complex cDNA library obtained from a target species. Clones are arrayed into multi-
c well plates. Each well contains 16 oligonucleotides (see ABV74137) with a 5' polylinker, a poly-T run capable of binding cDNAs by their poly-A tail and a unique 3' sequence, which allows an anchored oligonucleotide in c each well to selectively hybridise only to those cDNA clones with a c comprehensive level of degeneracy since they are diverse and numerous c enough to ensure that every possible cDNA sequence can be bound by an individual, specific oligonucleotide in a single well. The cDNA library is heated to denature the clones into single stranded DNA, and an aliquot is added to every well. The anchored oligonucleotide serves as the 3'
                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying nucleic acid encoding novel sex-linked-tissue-linked receptors, useful for isolating odorant binding proteins or pesticide alternatives, by analyzing sequences from a male- and female-specific nucleic acid library.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          G-protein coupled receptor; odourant; receptor; olfaction; array; microarray; anosmia; attractant; arometic; pesticide; ss.

CC The present sequence is that of a poly-T oligonucleotide used in a method CC designed to rapidly array and normalize a complex cDNA library obtained CC from a target species. Clones are arrayed into multi-well plates. Each CC well contains 16 oligonucleotides with a 5' polylinker, a poly-T run CC capable of binding cDNAs by their poly-A tail and a unique 3' sequence, which allows an anchored oligonucleotide in each well to selectively compice 3' key sequences are designed to give a comprehensive level of degeneracy since they are diverse and numerous enough to ensure that every possible cDNA sequence can be bound by an individual, specific CC oligonucleotide in a single well. The cDNA library is heated to denature the common 5' region present in every cDNA clones erves as the 3' primer in PCR, and CC the common 5' region present in every cDNA clone serves as the 5' priming site. Denaturing and washing leave anchored cDNA in each well. The CC library is now arrayed and normalised. The method was used to identify condurant receptors, and active effectors involved in the olfactory or neuronal proteins. The identified receptors and proteins are useful for identifying compounds that reduce a target contents are useful for identifying compounds that reduce a target that mask odours, or trapping invertebrates, e.g. odourant binding proteins, compounds or devices contents as ensitivity to odours, for manufacturing compounds or devices that mask odours, or trapping invertebrates with odourants.

CC semiochemicals (e.g. arometics or pheromone mimetics) can be developed controlling insect feeding and breeding behaviour, detecting the corresence of small air-borne molecules, etc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ABV74141 standard; DNA; 15 BP.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Best Local Similarity Matches 15; Conserv
                                 The present invention provides a method for deprotection of an oligonucleotide. This involves reacting a protected oligonucleotide, which is preferably covalently attached to a solid support through a linkage, with a deprotection reagent comprising an active methylene compound and an amine reagent. The process and reagent minimise siderections leading to certain impurities that contaminate synthetic oligonucleotides. The present sequence is a T15 phosphoramidite oligonucleotide having a quencher moiety (0) and minor groove binder (CDPI3) at the 3' end, which was synthesised in an example of the invention. This protected oligonucleotide was treated either with 15% ethanolic ammonia or with 3% diethylmalonate (DEM) dissolved in 15% ethanolic ammonia for 2 hours at 5 degrees C. HPLC analysis showed that deprotection without DEM yielded a complex mixture of products containing only 26.5% of the desired product. When DEM was used, 76.8% of the
                                                                                                                                                                                                                                                                     New oligonucleotide deprotection reagent useful for deprotecting oligonucleotide comprises an active methylene compound and an am

The invention discloses a hairpin sensor comprising a hairpin loop converse repeat arm and a second inverse repeat arm, and a quenchable conjugated inverse repeat arm and a second inverse repeat arm, and a quenchable conjugated inverse repeat arm of the hairpin loop assembly opposite the complementary probe. Also claimed is a microarray comprising the hairpin complementary probe. Also claimed is a microarray comprising the hairpin complementary probe is bound, directly or indirectly, to a support, a kit conjugated is a microarray comprising the hairpin complementary probe is bound, directly or indirectly, to a support, a kit conjugated is a conductive or semi-conductive, including at least one of the particle is conductive or semi-conductive, including at least one of the cabove hairpin sensor assemblies. The hairpin sensor further comprises a functional group joined to the end of the first inverse repeat arm composite the complementary probe, or first spacer opposite the first inverse repeat arm comprises a ligand positioned content of the first inverse repeat arm and the quenchable fluorescing agent, where the ligand is selected from mercapto, hydroxyl, amino, carboxyl, carbo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RESULT 2754

The invention relates to a novel method of inhibiting the expression of one or more genes or RNA transcripts by administering at least one oligomucleotide analogue that includes at least one hydroxyproline nucleic acid (HypNA) monomer to a cell or organism or their extracts. To oligonucleotides of the invention may be used to monitor properties including gene expression, respiration, secretion, signalling, ion-channel activity, cell motility, developmental phenotype and tumour regression. Furthermore, they may be utilised to determine the effects particular genes, as antisense or homologous recombination constructs e.g. for creating animal models of disease and finally, for increasing the activity of some enzymes, such as polymerases. The current sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    hairpin sensors. The two or more hairpin sensors include complementary probes that are the same or different and respective quenchable fluorescing agents that are the same or different. The two or more hairpin sensors are arranged in a spatially-defined pattern. The sensor and system are useful for detecting a target nucleotide sequence in a sample. Further, the method involves identifying the target nucleotide sequence by the location of the complementary probe to which the target nucleotide sequence binds. The two or more hairpin sensors include complementary probes or quenchable fluorescing agents, that are different. The sequence presented is the hairpin oligonucleotide target sequence, #1, used in an example of the invention.

Annealing control primer to improve annealing specificity in nucleic amplification, has region complementary to target, arbitrary nucleoti sequence, regulator with universal base/non-discriminatory base analogs. ide

Example 2; SEQ ID NO 54; 190pp; English.

WPI; 2003-627256/59

CC improving the annealing specificity in nucleic acid amplification. (1)
CC has a 3'-end portion with a nucleotide sequence complementary to a site
CC on a template nucleic acid for hybridisation, a 5'-end portion having a
CC pre-selected arbitrary nucleotide sequence, and a regulator portion
CC between the 3' and 5'-end portions, comprising a universal or nonCC discriminatory base analogue, where the regulator portion is capable of
CC regulating an annealing portion of the primer in association with
CC annealing temperature. (1) is useful for improving annealing specificity
CC in nucleic acid amplification. (1) is useful for amplifying a nucleic
CC acid sequence from a DNA or a mixture of nucleic acids, for selectively
CC amplifying a target nucleic acid sequence from a DNA, and for selectively
CC amplifying a target nucleic acid sequence from a MNA, by reverse
CC transcribing the mRNA and performing an amplification reaction using (1).
CC expressed mRNA in two or more nucleic acid semples, by reverse
CC transcribing the mRNA and performing an amplification reaction using (1).
CC is also useful for applily amplifying a target cDNA fragment
CC comprising a cDNA region corresponding to the 3'-end or 5'-end region of
CC an mRNA, for amplifying a population of full-length double-stranded cDNAs
CC complementary to mRNAs, and amplifying 5'-enriched double-stranded cDNAs The present invention describes an annealing control primer (ACP) for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   target nucleotide sequence simultaneously using more than one pair of primers in the same reaction, where the primers are derived from (1), for producing a DNA fingerprint of genomic DNA (gDNA), for producing a RNA fingerprint of an mRNA sample, identifying conserved homology segments in a multigene family from an mRNA sample, and for identifying conserved homology segments in a multigene family from gDNA. (1) is also useful for identifying a nucleotide variation in a target nucleic acid, and for mutagenesis in a target nucleic acid. The present sequence represents a primer which is used in the exemplification of the present invention.
The specification describes antisense oligonucleotides (AAX52869-X55271) directed against at least 2 mRNAs selected from target genes, coding and non-coding regions of RNAs corresponding to target genes, gene initiation codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-end and the juxta-section between coding and non-coding regions and all segments of RNAs encoding proteins associated with one or more diseases, conditions or mixtures. The antisense oligonucleotides may be derived from sequences AAX55272-74. These multiple target oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antisense oligonucleotide; multiple target; antisense treatment; impaired respiration; inflammation; lung disease; pulmonary vasoconstriction; inflammation; allergic rhinitis; acute asthma; allergy; asthma; impeded respiration; respiratory distress syndrome; pain; cystic fibrosis; pulmonary hypertension; pulmonary vasoconstriction; emphysema; chronic obstructive pulmonary disease; leukemia; lymphoma; carcinoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     complementary to mRNA. (I) is also useful for amplifying more than target nucleotide sequence simultaneously using more than one pair.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 15 BP; 0 A; 0 C; 0 G; 15 T; 0 U; 0 Other;

Typical diseases and conditions are those associated with impaired respiration and inflammation, including lung diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis, acute asthma, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e. colon cancer, breast cancer, lung cancer, pancreatic cancer, hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, well as all types of cancers which may metastasize or have metastasized to the lungs, including breast and prostate cancer
                                          This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta -N3'; or (X)m5'-(gamma)k-delta-N3'; where X = a labelled compound and/or a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or thymine; gamma = thymine; k = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-DCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAX18365 standard; DNA; 16 BP

The invention relates to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta -N3'; or (X)m5'-(gamma)k-delta-N3'; where X = a labelled compound and/or a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, guanine or cytosine; N = adenine, guanine or thymine; N = adenine, guanine or thymine; gamma = thymine; k = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Peptides having at least two new nucleotides - useful as primers in \ensuremath{\mathsf{PCR}} .
Human; adenosine receptor; low adenosine antisense oligonucleotide;
phosphorothioate; impaired respiration; inflammation; allergy;
                                                                                                                                                                                                                                                                                                                            Sequence 16 BP; 1 A; 0 C; 1 G; 14 T; 0 U; 0 Other,

The present invention describes a new composition comprising an antisense considered cold with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic, or antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating e.g. ischaemic conditions, pulmonary vasoconstruction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukaemias, lymphomas, control of the adenosine content of the control of decryadenosine which may metastasise to the lungs, including threast and prostate cancer. The reduction of the adenosine content of the crelease of decryadenosine which activates adenosine receptors causing bronchoconstriction and inflammation. AAA32311 to AAA32312 represent the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             allergic disease; bronchoconstriction; inhibitor; antiinflammatory; antiallergic; antiasthmatic; cytostatic; analgesic; impaired airway; lung, disease; ischaemic condition; pulmonary vasoconstriction; asthma; respiratory distress syndrome; pain; cystic fibrosis; emphysema; pulmonary hypertension; chronic obstructive pulmonary disease; COPD; cancer; leukaemia; lymphoma; carcinoma; metastasis; ss.
uncleotide sequences given in the sequence listing from the present invention, which correspond to SEQ ID NO:1 to 1815, and then the last 185 sequences are also called SEQ ID NO:1 to 185, but the sequences differ from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to AAA33992) are specifically claimed ONs from the present invention. N.B. Sequences given in the disclosure of the present invention do not match up with their corresponding SEQ ID NO: sequences given in the sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense oligonucleotides useful for treating e.g. pulmonary vasoconstruction, inflammation, allergies, asthma, hypertension, bronchitis, emphysema, respiratory distress syndrome, ischemia or

The present invention describes low adenosine (A) content antisense coligonucleotides the A is replaced by a 'Universal' or alternative base. (C (I) can have respiratory, bronchodilator, antiinflammatory, analysesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with c lung/respiratory disorders and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and c chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adhesion molecules and their receptors, cytokine and c chemokine receptors, adenosine receptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system or receptors, binding proteins and malignancy associated proteins. The c receptors, binding proteins and malignancy associated proteins. The c antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergy(se) and/or surfactant hypoproduction which are associated with a disease or c condition selected from pulmonary vasoconstriction, allergy(se) and/or allergies, asthma, impeded respiration, respiratory distress syndrome (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), hypertension, emphysema, chronic obstructive pulmonary processed (COPD), and/or cancer. AAF18434 to AAF21543 represent human polynucleotide c the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (NYEC-)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 surfactant depletion; respiratory; bronchodilator; antiinflammatory; immunosuppressive; antiasthmatic; analgesic; hypotensive; cytostatic; respiratory obstruction; pulmonary obstruction; impeded respiration; surfactant hypoproduction; pulmonary vasoconstriction; sathma; RDS; respiratory distress syndrome; pain; cystic fibrosis; allergic rhinitis; pulmonary hypertension; emphysema; pulmonary transplantation rejection; pulmonary hypertension; emphysema; pulmonary transplantation rejection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human C/EBP polynucleotide fragment #2191.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   06-APR-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         र्
                                                                                                                                                    The present sequence is that of a perfectly matched target sequence for a complecular beacon comprising an oligonucleotide probe (see ABL57069) covalently attached at the 3' end to fluorescent dye and at the 5' end to can annoparticle. In the native state, the probe forms a hairpin comprising conformation with hybridised termini. The proximity of the fluorophore and quencher (gold nanoparticle) in the molecular beacon results in complementary stretch of the probe to a target sequence, such as the corresponding to the amount of the central complementary stretch of the probe to a target sequence, such as the complementary stretch of the probe to a target sequence, such as the complementary stretch of the probe to a target sequence, such as the complementary stretch of the probe to a target sequence, such as the complementary stretch of the probe to a target sequence, such as the complementary stretch of the extent of which is proportional to the amount of target sequence, the extent of which is proportional to the invention relates generally to the use of metal surface quenchers can be detected. The invention relates generally to the use of metal surface quenchers can be detected. The invention relates generally to the use of metal surface quenchers can be detected.                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the cinitiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an cantiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antianflammatory steroid in a subject, for reducing or depleting levels of or reducing sensitivity to adenosine, reducing levels of adenosine antiinflammatory approached the prophylactic or therapeutic or therapeutic respiratory effects of a subject, for reducing levels of adenosine antiinflammatory steroid in a subject, for reducing levels of adenosine approached the prophylactic or therapeutic prophylactic or prophylactic or prophylactic or prophylactic prophylactic or prophylactic p

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a method for detecting interactions between biological components using a nonlinear optical technique. The invention is used for screening candidate binding partner(s) for binding to test molecule. It can also be used to detect changes in orientation or conformation of the probe and/or target. The present sequence is a target

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel method of inhibiting the expression of one or more genes or RNA transcripts by administering at least one oligonucleotide analogue that includes at least one hydroxyproline nucleic acid (HypNA) monomer to a cell or organism or their extracts. The oligonucleotides of the invention may be used to monitor properties including gene expression, respiration, secretion, signalling, ion-channel activity, cell motility, developmental phenotype and tumour regression. Furthermore, they may be utilised to determine the effects of particular genes, as antisense or homologous recombination constructs e.g. for creating animal models of disease and finally, for increasing the activity of some enzymes, such as polymerases. The current sequence is that of the PNA-HypNA hybridisation oligomer of the invention. This sequence may also comprise phosphono-PNA (pPNA) and serine nucleic acid (serNA)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Key

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the first-like tyrosine kinase 1 (fir-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (fik-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acid molecule modulating VEGF receptor(s) gene expression or stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             26-OCT-1995;

          PCR primers AAV37933-39 are used in the course of the invention. The specification describes a novel protein isolated from leukocytes of patients with 1gA nephropathy. Oligonucleotides based on the DNA sequence encoding this protein are useful as reagents for diagnosing and treating
                                                                                                                                                                                                                    Ishiwata I
Nomura N,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGP). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can 1 treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAV37934;

                                                                         AAV49503-V49507 are primers used in the isolation of a human eosinophil cell activator. This protein and antibodies generated from the protein can be used for treatment and discosis of malignant cumours, parasitic infections, allergic inflammation, eosinophilic pneumonia, rapid onset eosinophilia, and autoimmune diseases. DNA can be used for diagnosis, an the antisense DNA in gene therapy of these disorders. The protein can be

                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula: (X)m5' (alpha)n-beta -N3'; or (X)m5' (gammal)-Gelta-N3'; where X = a labelled compound and/or a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, guanine or cytosine; N = adenine, guanine or thymine; pamma = thymine; k = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene
                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Disclosure; Page 11; 19pp; Japanese.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents a PCR primer used in the identification of a human pollenosis associated gene. The gene is highly expressed in individuals with high pollen-specific immunoglobulin E (IgE) levels. Invention relates to the nucleotide sequence encoding the pollenosis associated protein, diagnosing pollenosis and screening candidate compounds for treating pollenosis. The gene can be used in diagnosing pollenosis, particularly cedar pollenosis, and screening candidate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nagasu T, !

```

This sequence represents a PCR primer used in the identification human pollenosis associated gene. The gene is highly expressed in individuals with high pollen-specific immunoglobulin E (19E) leve invention relates to the nucleotide sequence encoding the pollenous transfer of the pollenous transfer in the pollenous transfer of t

pollenosis

levels. The

                                                                                                                                          This invention describes novel DNA sequences preferentially expressed in IgA nephropathy patients, and DNA sequences stringently hybridizing to them. Independent claims cover diagnostic reagents for IgA nephropathy incorporating the antisense sequences; the treatment of IgA nephropathy using the antisense sequences for mRNA inhibition; proteins associated with IgA nephropathy, containing sequences encoded by the DNA sequences; antibodies recognizing these proteins; the production of the proteins by culture of host cells transformed with DNA encoding them; diagnostic reagents for IgA nephropathy containing the antibodies; and compositions for the treatment of IgA nephropathy which contain the antibodies. The products of the invention can be used for the diagnosis and treatment of IgA nephropathy. This sequence represents a primer used in the isolation and identification of the human IgA nephropathy-associated proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ishiwata 1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Park A
                                                                                                                                                                                                                         IgA nephropathy patients, and DNA sequences stringently hybridizing to them. Independent claims cover diagnostic reagents for IgA nephropathy incorporating the antisense sequences; the treatment of IgA nephropathy using the antisense sequences for mRNA inhibition; proteins associated with IgA nephropathy, containing sequences encoded by the DNA sequences; antibodies recognizing these proteins; the production of the proteins by culture of host cells transformed with DNA encoding them, diagnostic reagents for IgA nephropathy containing the antibodies; and compositions for the treatment of IgA nephropathy which contain the antibodies. The products of the invention can be used for the diagnosis and treatment of IgA nephropathy. This sequence represents a primer used in the isolation and identification of the human IgA nephropathy-associated proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes a novel method for analysis of an RNA sample which comprises amplifying cDNA with first and second differently labeled primers and analysis of the amplified labeled cDNA. The method is useful for analyzing differential gene expression, for identifying and/or characterizing pharmacological activities or for identifying target genes. The use of different primer combinations allow more cDNAs to be amplified. The method also provides a more detailed analysis than prior arthodom. This sequence represents a primer used to illustrate the
                                                                                                                                                                                                                                                                                                     Stimulus-regulated nucleic acid; sequence profile; nucleic acid level; differentially expressed nucleic acid; disease state; cancer; autoimmune disease; infectious disease; aging; developmental disorder; proliferative disorder; neurological disorder; toxicity; primer; treatment resistance; differential expression; drug discovery; growth factor; epidermal growth factor; radiation; stress; pathogen; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              07-SEP-1998;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Unidentified.

                                                                                     Query Match
                                                                                                                                                      target. The method comprises contacting a probe with an arbitrarily or statistically sampled target and detecting the amount of specific binding of the target to the probe. The methods can be used to identify differentially expressed nucleic acid molecules associated with disease states, such as cancer, autoimmune disease, infectious disease, sidny, developmental disorder, proliferative disorder or neurological disorder. Alternatively the methods can be used to assess the efficacy or toxicity of or a resistance to a treatment. Also the methods can be used to determine differential expression of nucleic acid molecules in response to a stimulus, e.g. a chemical, drug or growth factor (especially epidermal growth factor), radiation, stress or a pathogen. The methods can be used to determine co-regulated genes that can be potential

Pollinosis-associated gene 373 undergoing significantly low expression subjects with high cedar pollen-specific immunoglobulin-E levels, usefi in diagnosis of allergic diseases and screening drug candidates.

Example 6; Page 69; 80pp; Japanese

The invention relates to the human pollinosis-associated gene 373 which CC exhibits significantly reduced expression in the T-cells of individuals CC with high cedar pollen-specific IgE (immunoglobulin E) levels. The gene CC with high cedar pollen-specific IgE (immunoglobulin E) levels. The gene CC with high cedar pollen from individuals allergic to cedar pollen using CC the differential display method. The invention also relates also relates to the protein encoded by pollinosis gene 373; expression constructs and CC host cells comprising pollinosis-associated gene 373 nucleic acids; pollinosis-associated gene 373 primers and probes; antibodies against the CC protein encoded by the gene; methods of detection of pollinosis of allergic diseases via the detection of pollinosis-associated gene 373 nucleic acids. The invention additionally encompasses methods of screening drug CC candidates for the treatment of allergic disease by measuring the CC expression of pollinosis-associated gene 373 in pollen antigen-stimulated CC T-cells in the presence of a test compound relative to a control. CC diseases and in the screening of drug candidates for the treatment of Such diseases. The present sequence represents a PCR primer used in the control final processor of the present sequence area and primer used in the control control control diseases. The present sequence represents a PCR primer used in the control control control control control control control diseases. of human pollinosis-associated gene 373 cDNA

Pollinosis-associated gene 419 undergoing significantly low subjects with high cedar pollen-specific IgE levels, useful of allergic diseases and screening drug candidates. expression in in diagnosis

Example 6; Page 49; 77pp; Japanese

The invention relates to the human pollinosis-associated gene 419 which exhibits reduced expression in the T-cells of individuals with high cedar pollen-specific IgE (immunoglobulin E) levels. The gene was isolated from T-cells from individuals allergic to cedar pollen using the differential display method. Pollinosis-associated gene 419 has homology with the gene encoding human Fas-associated

The invention additionally encompasses methods of screening drug candidates for the treatment of allergic disease by measuring the expression of pollinosis-associated gene 419 in pollen antigen-stimulated T-cells in the presence of a test compound relative to a control pollinosis-associated gene 419 is useful in the diagnosis of allergic diseases and in the screening of drug candidates for the treatment of such diseases. The present sequence represents a PCR primer used in the isolation of human pollinosis-associated gene 419 cDNA
The invention relates to the human pollinosis-associated gene 419 which exhibits reduced expression in the T-cells of individuals with high cedar pollen-specific IgE (immunoglobulin E) levels. The gene was isolated from T-cells from individuals allergic to cedar pollen using the differential display method. Pollinosis-associated gene 419 has homology with the gene encoding human Fas-associated factor-1 (FAF-1). The invention also relates to the protein encoded by pollinosis gene 419; expression constructs and host cells comprising pollinosis-associated gene 419 primers and probes; nucleic acids; pollinosis-associated gene 419 primers and probes;
                                                                                                                                                                                                                                                                                                                                   Nagasu T,
Obayashi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; pollinosis-associated gene 419; FAF-1 homologue; Fas-associated factor-1; IgE; immunoglobulin E; cedar pollen allergy; T-cell; reduced expression; detection; diagnosis; drug screening;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAC64182 standard; DNA; 17
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                       Pollinosis-associated gene 419 undergoing significantly low subjects with high cedar pollen-specific IgE levels, useful of allergic diseases and screening drug candidates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              26-APR-2000; 2000WO-JP002729

antibodies against the protein encoded by the gene; methods of detection of pollinosis-associated gene 419 nucleic acids; and a method of diagnosis of allergic diseases via the detection of pollinosis-associated gene 419 nucleic acids. The invention additionally encompasses methods of screening drug candidates for the treatment of allergic disease by measuring the expression of pollinosis-associated gene 419 in pollen antigen-stimulated T-cells in the presence of a test compound relative to a control.pollinosis-associated gene 419 is useful in the diagnosis of allergic diseases and in the screening of drug candidates for the treatment of such diseases. The present sequence represents a PCR primer used in the isolation of human pollinosis-associated gene 419 cDNA

Pollinosis-associated subjects with high ced of allergic diseases a cedar es and gene 513 undergoing significantly low expression dar pollen-specific IgE levels, useful in diagnosiand screening drug candidates. xpression in 1 diagnosis

Example 6. Page 38; 46pp; Japanese

The invention relates to the human pollinosis-associated gene 513 which exhibits significantly reduced expression in the T-cells of individuals with high cedar pollen-specific IgE (immunoglobulin E) levels. The gene was isolated from T-cells from individuals allergic to cedar pollen using the differential display method. The invention also relates to methods of detection of pollinosis-associated gene 513 nucleic acids; a method of diagnosis of allergic diseases via the detection of pollinosis-associated gene 513 nucleic acids; and methods of screening drug candidates for the reatment of allergic disease by measuring the expression of pollinosis-associated gene 513 in pollen antigen-stimulated T-cells in the presence of a test compound relative to a control. Pollinosis-associated gene 513 in pollen antigen-stimulated T-cells in the screening of useful in the diagnosis of allergic diseases and in the screening of trug candidates for the treatment of such diseases. The present sequence

                                                                                                                                                                                                                       The invention relates to the human pollinosis-associated gene 581 which ce exhibite significantly reduced expression in the T-cells of individuals with high cedar pollen-specific IgE (immunoglobulin E) levels. The gene ce was isolated from T-cells from individuals allergic to cedar pollen using the differential display method. The invention also relates also relates to the protein encoded by pollinosis-associated gene 581; to expression constructs and host cells comprising pollinosis-associated gene 581 mucleic acids; pollinosis-associated gene; methods of detection antibodies against the protein encoded by the gene; methods of detection control of allergic diseases via the detection of pollinosis-associated gene 581 nucleic acids; and a method of diagnosis of allergic diseases via the detection of pollinosis-associated gene 581 nucleic acids. The invention additionally encompasses methods of screening drug candidates for the treatment of allergic disease by measuring the expression of pollinosis-associated gene 581 in pollen antigen-stimulated T-cells in the presence of a test compound relative to allergic disease and in the greening of drug candidates for the diagnosis of allergic disease of allergic disease of the detection of pollinosis-associated gene 581 in the diagnosis of allergic disease of the disease of allergic disease of the disease of

                                                                                                                                                                                                                  cc exhibits significantly reduced expression in the T-cells of individuals control with high cedar pollen-specific IgE (immunoglobulin E) levels. The gene cc was isolated from T-cells from individuals allergic to cedar pollen using the differential display method. The invention also relates also relates cto the protein encoded by pollinosis-associated gene S81; to expression cc constructs and host cells comprising pollinosis-associated gene S81; to expression cc constructs and host cells comprising pollinosis-associated gene S81 primers and probes; contibodies against the protein encoded by the gene; methods of detection of pollinosis-associated gene S81 nucleic acids; and a method of cc gene 581 nucleic acids; and a method of cc gene 581 nucleic acids. The invention additionally encompasses methods of cc gene 581 nucleic acids. The invention additionally encompasses methods of cc artigen-stimulated T-cells in the treatment of allergic disease by cc measuring the expression of pollinosis-associated gene 581 in pollen can control pollinosis-associated gene 581 in the disgnosis of callergic diseases and in the presence of a test compound relative to callergic diseases and in the screening of drug candidates for the creatment of such diseases. The present sequence represents a PCR primer cc used in the isolation of human pollinosis-associated gene 581 cDNA

                                                                                                                                                                           S
```

The invention relates to the human pollinosis-associated gene 627 which CC exhibits significantly reduced expression in the T-cells of individuals CC with high cedar pollen-specific IgE (Ammunoglobulin E) levels. The gene CC was isolated from T-cells from individuals allergic to cedar pollen using the differential display method. The invention also relates to methods of CC diagnosis of allergic diseases via the detection of pollinosis-associated gene 627 nucleic acids; a method of CC gene 627 nucleic acids; and a method of screening drug candidates for the treatment of allergic disease by measuring the expression of pollinosis-associated gene 627 in pollien antigen-stimulated T-cells in the presence CC associated gene 627 in pollien antigen-stimulated T-cells in the presence CC is useful in the diagnosis of allergic diseases and in the screening of CC drug candidates for the treatment of such diseases. The present sequence represents a PCR primer used in the isolation of human pollinosis-

                                                                                                                                                                                                                                                                                                                      RESULT 2787
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to the human pollinosis-associated gene 627 which CC exhibits significantly reduced expression in the T-cells of individuals CC with high cedar pollen-specific IgE (immunoglobulin E) levels. The gene CC was isolated from T-cells from individuals allergic to cedar pollen using the differential display method. The invention also relates to methods of CC detection of pollinosis-associated gene 627 nucleic acids; a method of CC diagnosis of allergic diseases via the detection of pollinosis-associated CC gene 627 nucleic acids; and a method of screening drug candidates for the treatment of allergic disease by measuring the expression of pollinosis-associated gene 627 in pollien antigen-stimulated T-cells in the presence CC of a test compound relative to a control. Pollinosis-associated gene 627 in the diagnosis of allergic diseases and in the screening of CC drug candidates for the treatment of such diseases. The present sequence CC represents a PCR primer used in the isolation of human pollinosis-CCC associated gene 627 cDNA

The invention relates to the human pollinosis-associated gene 795 which certainly reduced expression in the T-cells of individuals calibrated from T-cells from individuals allergic to cedar pollen-specific IgE (immunoglobulin E) levels. The gene curve was isolated from T-cells from individuals allergic to cedar pollen using the differential display method. Pollinosis-associated gene 795 has the homology with the human vimentin gene. The invention also relates also relates to the protein encoded by pollinosis-associated gene 795 to expression constructs and host cells comprising pollinosis-associated gene 795 mucleic acids; pollinosis-associated gene 795 rimers and probes; concleic acids; pollinosis-associated gene 795 mucleic acids; pollinosis-associated gene 795 mucleic acids; and a method of diagnosis of allergic diseases via the detection of pollinosis-associated gene 795 mucleic acids. The invention additionally encompasses methods of screening drug candidates for the treatment of allergic disease by measuring the expression of pollinosis-associated gene 795 in pollen cantigen-stimulated T-cells in the presence of a latergic disease by candidates for the treatment of allergic disease so do in the screening of drug candidates for the treatment of such diseases. The present sequence represents a PCR primer used in the isolation of human pollinosis-associated gene 795 cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nagasu T, Sı

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to the human pollinosis-associated gene 795 which CC exhibits significantly reduced expression in the T-cells of individuals CC with high cedar pollen-specific IgE (immunoglobulin E) levels. The gene CC was isolated from T-cells from individuals allergic to cedar pollen using the differential display method. Pollinosis-associated gene 795 has CC homology with the human vimentin gene. The invention also relates also CC constructs and host cells comprising pollinosis-associated gene 795 councleic acids; pollinosis-associated gene 795 primers and probes; CC antibodies against the protein encoded by the gene; methods of detection CC of pollinosis-associated gene 795 primers and probes; CC diagnosis of allergic diseases via the detection of pollinosis-associated gene 795 nucleic acids. The invention additionally encompasses methods of CC gene 795 nucleic acids. The invention additionally encompasses methods of CC exceening drug candidates for the treatment of allergic disease by a control. Pollinosis-associated gene 795 in pollen CC antigen-stimulated T-cells in the presence of a test compound relative to CC acontrol. Pollinosis-associated gene 795 in useful in the dangnosis of allergic diseases and in the screening of drug candidates for the creatment of such diseases. The present sequence represents a PCR primer CC used in the isolation of human pollinosis-associated gene 795 cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

Yokoi A;
                                                                                                                                                                                                       The present invention describes the human pollinosis-associated gene 465 which has a nucleic acid sequence of 3442 base pairs (bp), given in (AAC92291), that undergoes significantly low expression in subjects after pollen scattering, and is useful in the diagnosis of allergic diseases and screening candidate compounds for remedies capable of regulating the response of T cells to the stimulus by an antigen. The gene is useful in the diagnosis of allergic diseases and screening candidate compounds for remedies capable of regulating the response of T cells to the stimulus by an antigen. The present sequence represents a PCR primer which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                diseases cells to

The gene is useful in the diagnosis of allergic diseases and screening candidate compounds for remedies capable of regulating the response of T cells to the stimulus by an antigen. The present sequence represents a PCR primer which is used in an example from the present invention
                                                                                                          27-MAY-1999;

Pollinosis- associated gene is useful in the diagnosis of allergic diseases and in the screening drug candidates for the treatment of such diseases. The present seque represents a PCR primer used in the isolation of human pollinosis-associated gene 787 cDNA

The invention relates to the human pollinosis-associated gene 787 which exhibits significantly reduced expression in the T-cells of individuals after the pollen-scattering season, relative to expression levels in T-cells before the pollen-scattering season. The gene was isolated from T-cells from individuals allergic to pollen using the differential display method. The invention also relates to pollinosis-associated gene 787 primers and probes; methods of detection of pollinosis-associated gene 787 nucleic acids; and a method of diagnosis of allergic diseases via the detection of pollinosis associated gene 787 nucleic acids. The invention additionally encompasses a method of screening drug candidates for the diseases Pollinosis-associated gene 787 undergoing significantly low expression subjects after pollen scattering, useful in diagnosis of allergic diseases and screening candidate compounds to regulate response of T Example 6; antigen stimulus.
